1. ABSTRACT

The EventForce Management System is a Salesforce-based CRM solution designed to centralize and automate event planning operations. The system manages clients, events, venues, vendors, event-vendor assignments, and feedback within a single platform.

The solution addresses common operational problems such as fragmented information, manual event booking activities, venue double-booking risk, delayed reminders, uncontrolled cancellation requests, and limited operational visibility. Salesforce Custom Objects provide the core data structure, while Flows, Validation Rules, Formula Fields, Approval Processes, Apex Classes and Triggers provide automation and advanced business logic.

The system also provides role-based security, data migration support through the Salesforce Data Import Wizard, a Lightning App for navigation, and Reports and Dashboards for operational visibility. The implementation is organized into requirement analysis, project design, backend/configuration, UI/UX, data migration, testing and security activities.

2. INTRODUCTION

Event management involves coordinating clients, event schedules, venues, vendors, approvals and post-event feedback. When these activities are handled using separate files, spreadsheets, manual communication or disconnected systems, it becomes difficult to maintain consistent information and monitor the complete event lifecycle.

EventForce Management System uses Salesforce as a centralized CRM platform. The system stores business information in structured custom objects and automates important operational activities. The main business flow is:

Client Registration → Event Planning & Booking → Venue Selection & Reservation → Vendor Assignment → Event Reminders → Event Completion → Feedback Collection → Reporting

The project is intended to reduce manual effort, improve data accuracy, improve coordination and provide real-time visibility into event operations.

2.1 PURPOSE

The purpose of the EventForce Management System is to provide a centralized Salesforce platform for managing and automating event planning operations. The system is designed to:

- Centralize client, event, venue, vendor and feedback information.
- Streamline event booking and venue reservation activities.
- Prevent venue double bookings using Apex business logic.
- Automate event reminders and cancellation approval processes.
- Improve coordination between clients, event coordinators, vendors and venue managers.
- Provide reports and dashboards for operational visibility.
- Reduce manual processes and improve data accuracy.
- Improve the overall client experience.

3. IDEATION PHASE

The ideation phase identifies the operational problems faced by an event-management organization and maps them to a Salesforce-based solution.

The major problem areas are centralized information management, event booking coordination, venue availability, vendor coordination, timely communication, cancellation control, feedback tracking and reporting.

The proposed Salesforce solution uses Custom Objects for structured data, Flows for automation, Approval Processes for controlled cancellations, Apex for advanced venue-booking validation, security controls for user access, and Reports/Dashboards for operational monitoring.

3.1 PROBLEM STATEMENT

Event Operations Managers need to manage client, event, venue and vendor activities in a coordinated manner. When information and processes are handled manually or across separate systems, they may face difficulty maintaining centralized records, coordinating bookings, preventing venue conflicts, sending timely reminders, controlling cancellations and obtaining a consolidated operational view.

EventForce solves these problems by bringing event-related information and workflows into a single Salesforce CRM platform.

3.2 SOLUTION REQUIREMENTS

The system requirements are divided into Functional Requirements (Section 4.2) and Non-Functional Requirements (Section 4.3).

4. REQUIREMENT ANALYSIS PHASE

Requirement analysis defines what the EventForce system must do and how users will interact with it throughout the event lifecycle.

4.1 CUSTOMER JOURNEY MAP

Stage	Activity	Description
1	Event Enquiry & Client Registration	Client requirements and contact details are captured in Salesforce.
2	Event Planning & Booking	Event information such as event type, date, budget and status is created and managed.
3	Venue Selection & Reservation	Suitable venues are identified, availability is checked and reservations are managed while preventing double bookings.
4	Vendor Assignment & Coordination	Required vendors are assigned to the event through the EventVendor junction object.
5	Event Reminders & Communication	Automated reminders are generated for upcoming confirmed events.

Stage	Activity	Description
6	Event Completion & Feedback	After the event, feedback can be recorded against the event and client.
7	Reporting & Monitoring	Reports and dashboards provide visibility into upcoming events, event status and operational performance.

4.2 FUNCTIONAL REQUIREMENTS

ID	Requirement	Description
FR-1	Event Management	Create and manage event records, dates, types, status and budget information.
FR-2	Client Management	Maintain client details and associate clients with events.
FR-3	Venue Management	Maintain venue information and availability status.
FR-4	Vendor Management	Maintain vendor details, service information and status.
FR-5	Event–Vendor Assignment	Assign multiple vendors to an event using the EventVendor junction object.
FR-6	Venue Availability & Double-Booking Prevention	Validate venue availability and prevent conflicting bookings.
FR-7	Automated Event Reminders	Send reminders for upcoming confirmed events.
FR-8	Event Cancellation Approval	Route cancellation requests through an approval process.
FR-9	Feedback Management	Capture feedback and rating information.
FR-10	Reports & Dashboards	Provide event summaries, upcoming event insights and vendor/performance information.
FR-11	Event Status Automation	Update event-related status information through automation where required.
FR-12	Data Migration	Import validated records using the Salesforce Data Import Wizard.

4.3 NON-FUNCTIONAL REQUIREMENTS

Category	Requirement
Usability	Provide a Lightning App with clear navigation for event management.
Security	Use profiles, roles, permission sets, organization-wide defaults and sharing rules to control access.
Reliability	Maintain accurate automation, approval processing and venue booking validation.
Scalability	Structure the solution so that additional events, clients, vendors, venues and users can be supported.
Maintainability	Keep business logic and automation organized so that future changes can be implemented.

5. STAKEHOLDER MAPPING

Stakeholder	Role in the System
Clients	Request event services, provide feedback and view event updates.
Event Coordinators	Manage event scheduling, client communication and approval workflows.
Vendors	Handle assigned event services such as catering, decoration and logistics.
Venue Managers	Manage venue availability and reservations.
Event Administrators	Oversee system operations, security and data monitoring.

6. PROJECT DESIGN PHASE

The project design phase maps identified business problems to Salesforce capabilities.

6.1 PROBLEM–SOLUTION FIT

Problem	Solution
Client, event, venue and vendor information is difficult to manage centrally.	Custom Salesforce objects for Event, Client, Venue, Vendor, Feedback and EventVendor.
Event booking requires multiple manual activities.	Salesforce Flows and automated processes.
Venue double booking can occur.	Apex Trigger and VenueStatusHelper business logic to validate availability and prevent conflicting bookings.
Vendor coordination is difficult to track.	EventVendor junction object and Vendor records.
Clients may not receive timely event reminders.	A 3-Day Reminder Flow for confirmed upcoming events.
Cancellations require controlled processing.	Salesforce Approval Process with notifications and status updates.

6.2 DATA ARCHITECTURE

The core data architecture contains six custom objects:

No.	Object	Key Fields / Purpose
1	Event__c	Event Name, Event Date, Event Type, Event Status and Event Budget.
2	Client__c	Client Name, Email, Phone, Address, Country and City.
3	Vendor__c	Vendor Name, Email, Phone, Service Type and Status.
4	Venue__c	Venue Name, Address, Location URL, Capacity and Availability Status.
5	Feedback__c	Feedback ID (Auto Number), Rating and Comments.
6	EventVendor__c	Junction object connecting Event and Vendor for a many-to-many relationship.

Relationships

From Object	To Object	Relationship Type
Event	Client	Lookup
Event	Venue	Lookup
Feedback	Event	Lookup
Feedback	Client	Lookup
EventVendor	Event	Master-Detail
EventVendor	Vendor	Master-Detail

The EventVendor object enables a many-to-many relationship between Event and Vendor.

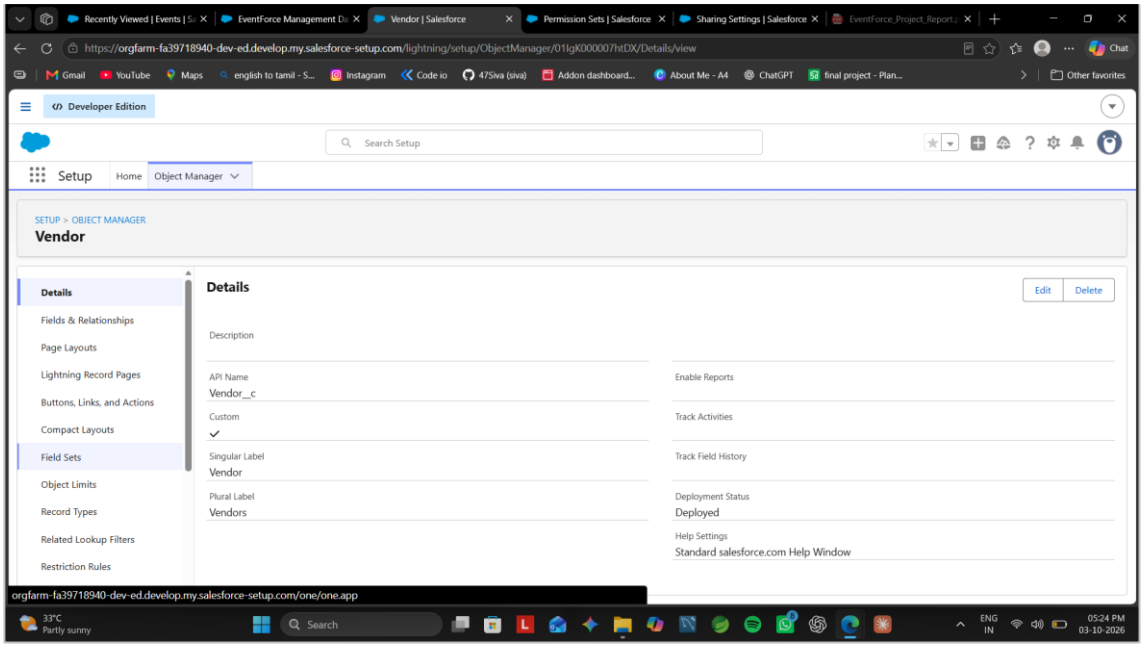

Figure 4: Vendor object details

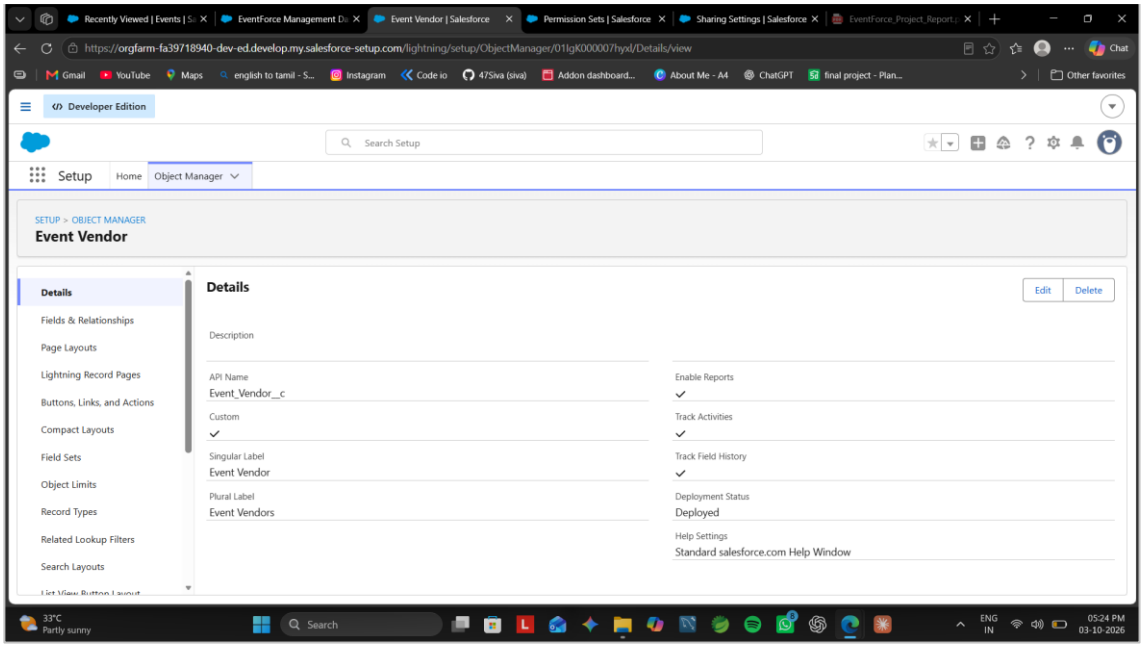

Figure 5: Event Vendor (junction) object details

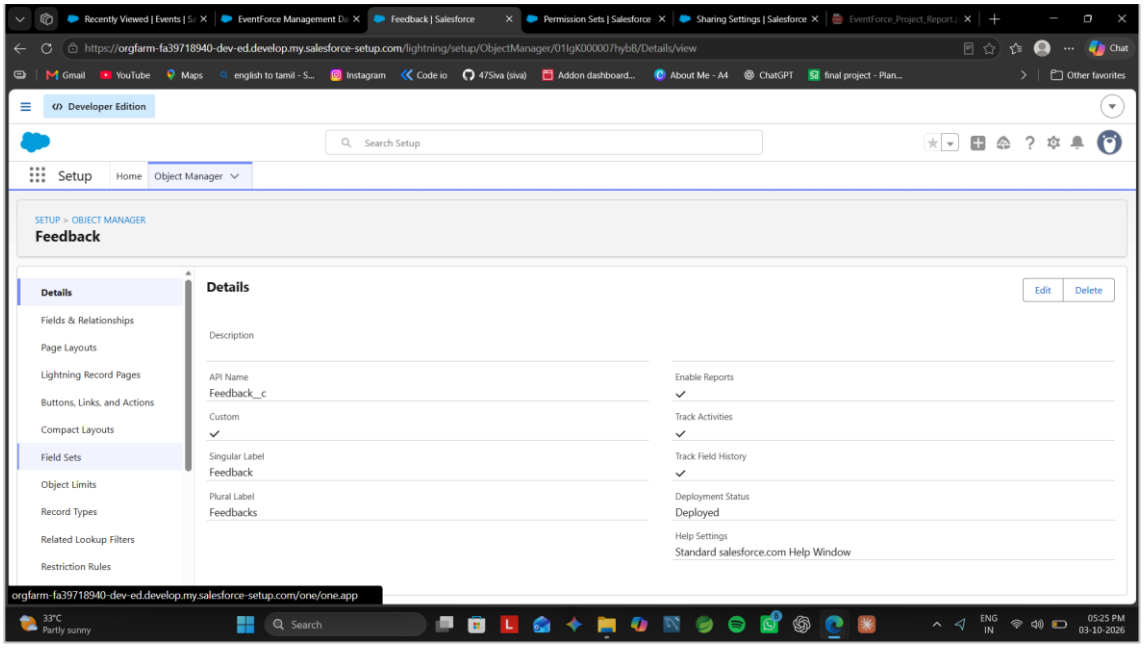

Figure 6: Feedback object details

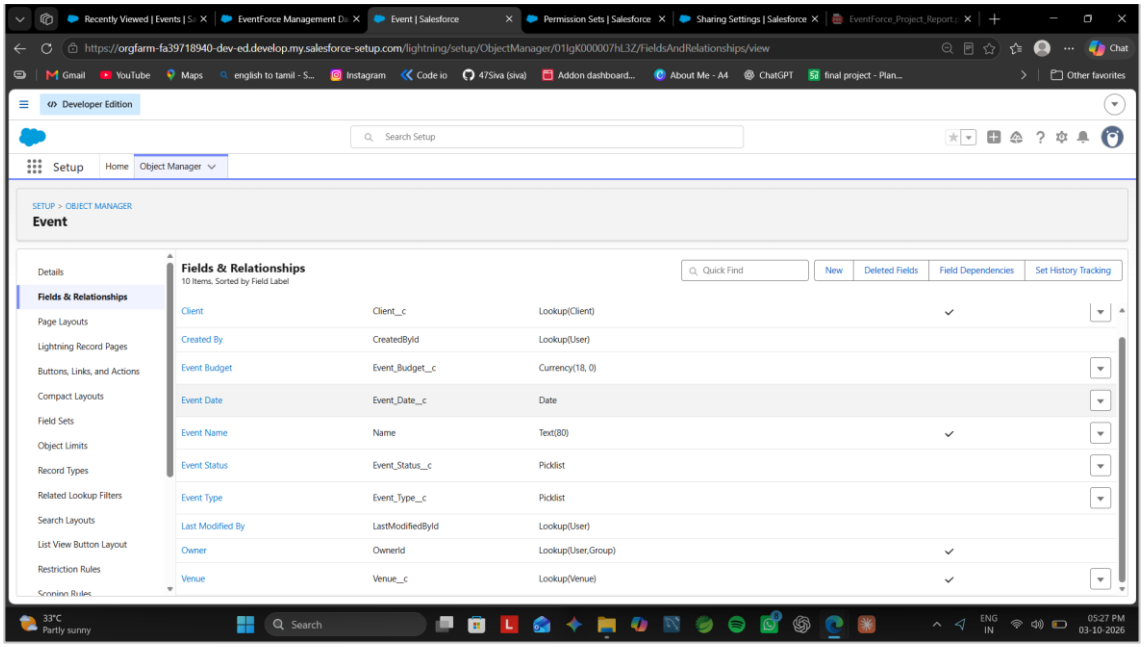

Figure 7: Event object – fields and relationships

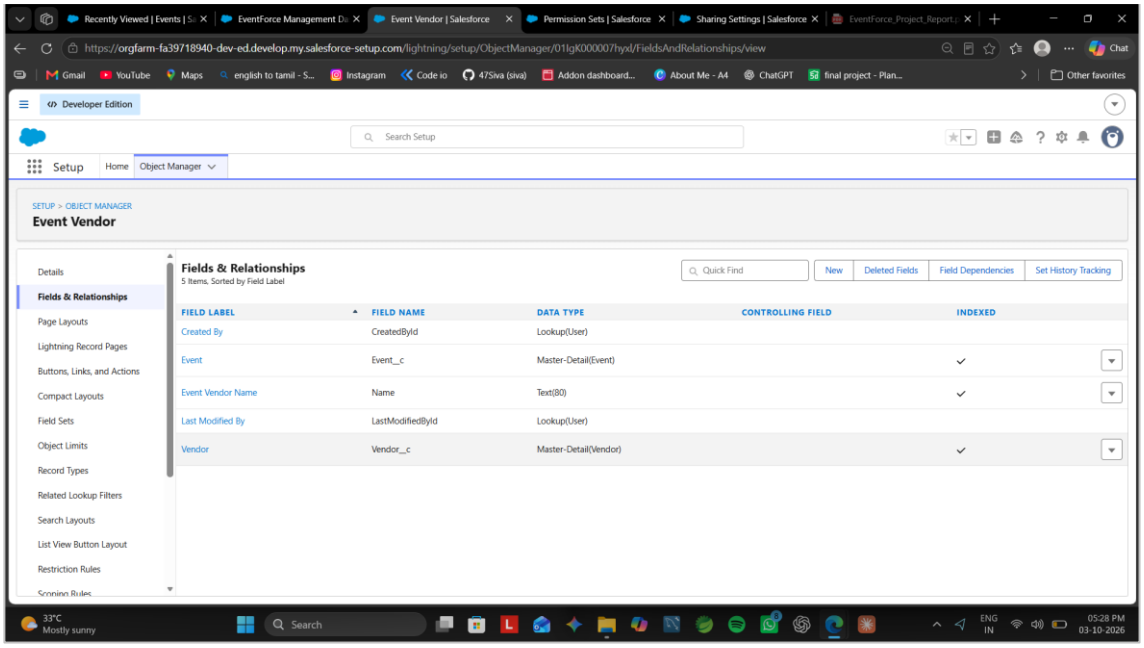

Figure 8: Event Vendor object – fields and relationships (Master-Detail)

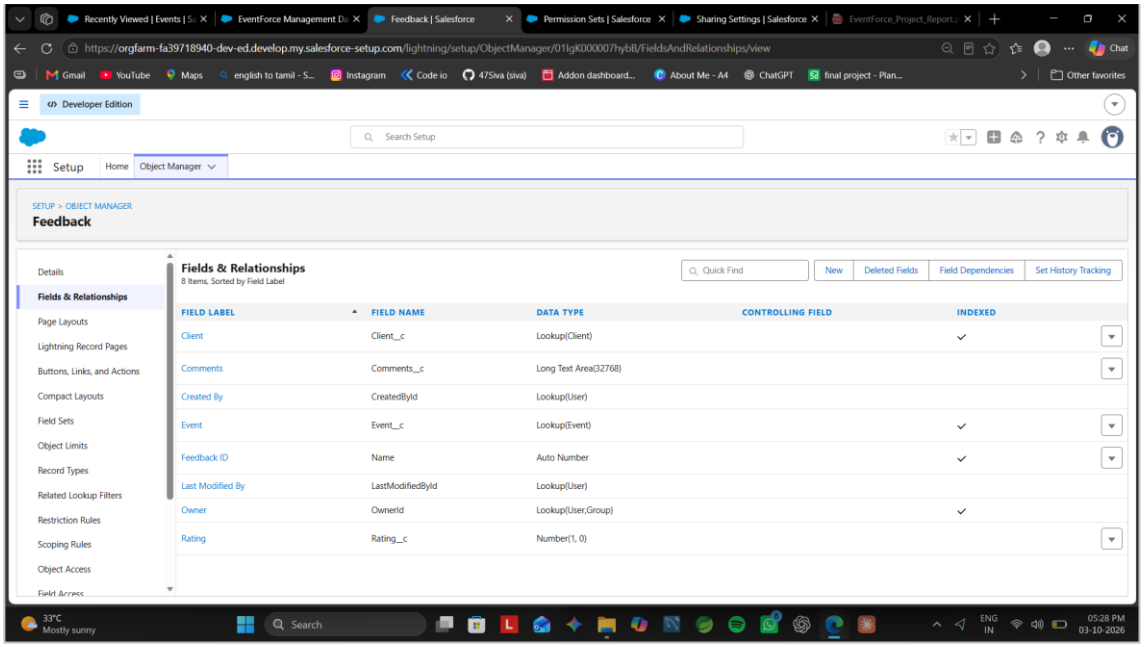

Figure 9: Feedback object – fields and relationships

7. AGILE PROJECT PLAN

The project follows an Agile-style sprint approach using Epics, User Stories and Story Points. Work is divided into four sprints so that the implementation can be developed and validated incrementally.

7.1 USER STORIES

ID	As a…	I want to…	So that…
US-01	Event Coordinator	create events with type, date and status	event information is standardized.

ID	As a…	I want to…	So that…
US-02	Event Coordinator	associate a client and venue with an event	coordination is centralized.
US-03	Vendor Manager	assign multiple vendors to an event	services can be coordinated.
US-04	Client	receive timely event reminders	I know when my event is approaching.
US-05	Event Coordinator	have cancellation requests follow an approval process	cancellations are controlled.
US-06	Venue Manager	have double bookings prevented	venue schedules remain accurate.
US-07	Event Administrator	have role-based access	users see only appropriate information.
US-08	Management	have reports and dashboards	event operations can be monitored.

7.2 SPRINT PLAN

Sprint	Focus Area	Duration	Capacity (SP)	Planned (SP)
Sprint 1	Event Management and Client/Venue Management	6 Days	20	8
Sprint 2	Vendor Management and Notifications/Automation	6 Days	20	8
Sprint 3	Approval Management and Venue Management/Apex	6 Days	20	13
Sprint 4	Security/Access Control and Reports/Dashboards	6 Days	20	10

Capacity is the planned sprint size; Planned is the total of the user-story points assigned to that sprint (see the User Story / Sprint Traceability table in the Appendix).

The sprint dates in the sample project tracker are retained as the reference schedule:

Sprint	Start Date	End Date
Sprint 1	24 Oct 2022	29 Oct 2022
Sprint 2	31 Oct 2022	05 Nov 2022
Sprint 3	07 Nov 2022	12 Nov 2022
Sprint 4	14 Nov 2022	19 Nov 2022

For a new implementation, these dates should be replaced with the actual project schedule.

8. PHASE 2 – BACKEND DEVELOPMENT & CONFIGURATIONS

The backend/configuration phase builds the functional engine of the system using Salesforce declarative automation, validation, approval processing, Apex logic and security configuration.

Major activities

- Create custom objects and fields.
- Configure relationships.
- Create validation rules and formula fields.
- Build record-triggered and scheduled/automated flows where required.
- Configure cancellation approval process.
- Implement Apex Trigger and helper logic for venue double-booking prevention.
- Configure profiles, roles and permission sets.
- Prepare reports and dashboard data sources.

8.1 AUTOMATION DESIGN

3-Day Reminder Flow: Event is checked for an upcoming date. When the event is confirmed and the reminder condition is met, the flow performs the configured reminder action.

Feedback Notification: Feedback-related automation can notify the appropriate users when feedback is created or updated.

Cancellation Approval: A cancellation request is submitted for approval. The approval process routes the request to the appropriate coordinator/approver and updates the event based on the approval result.

Event Status Automation: Flows can update event-related status values based on defined business conditions.

Venue Double-Booking Prevention: An Apex Trigger invokes venue validation logic so that a venue cannot be booked for conflicting event schedules.

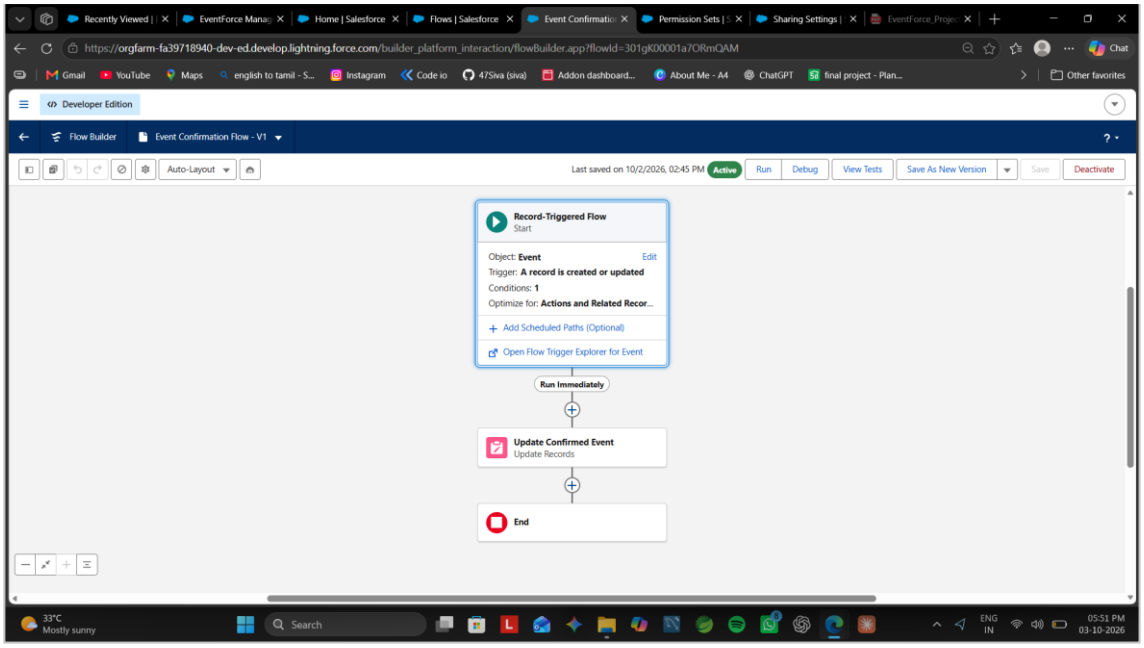

Figure 10: Event Confirmation Flow (record-triggered flow on Event)

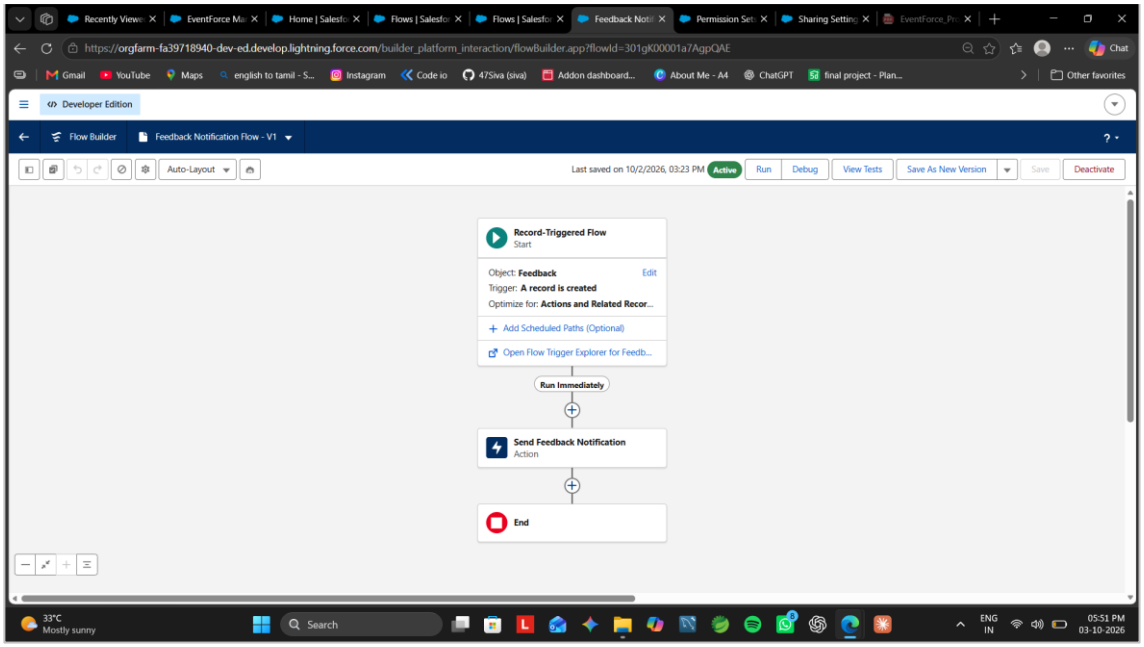

Figure 11: Feedback Notification Flow (record-triggered flow on Feedback)

8.2 VALIDATION RULES & FORMULA FIELDS

Validation Rules are used to improve data quality and prevent invalid records from being saved. Examples include enforcing required business information and preventing invalid booking conditions.

Formula Fields can be used for calculated or derived information, including event budget-related calculations where applicable.

The exact validation formulas should be finalized during configuration based on the actual field API names and business rules used in the Salesforce org.

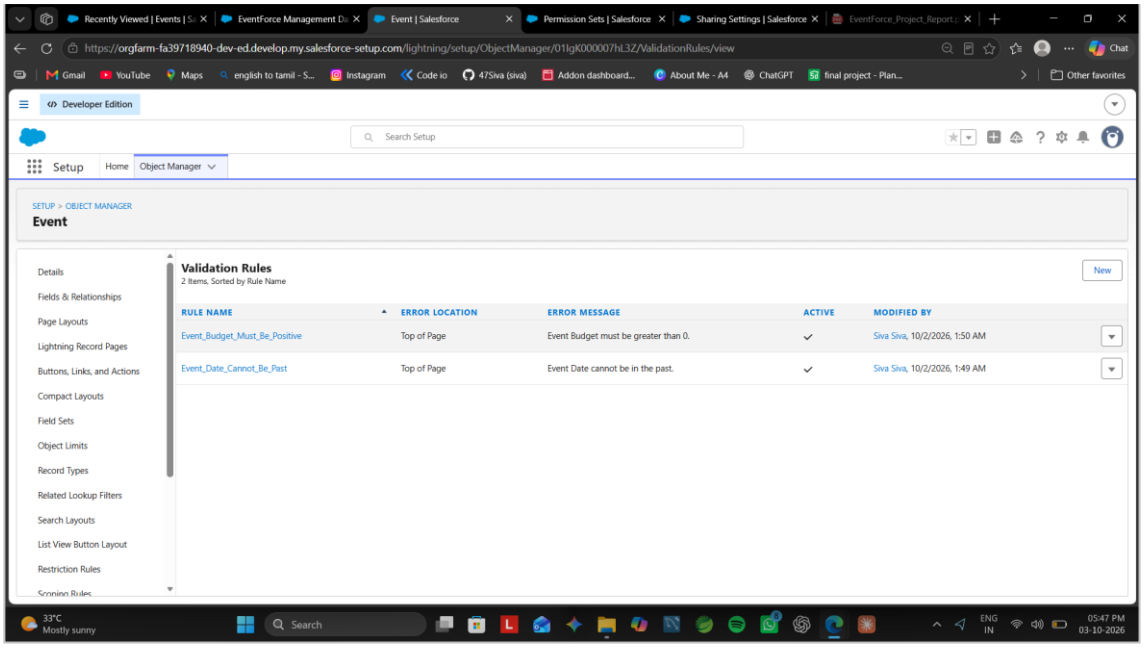

Figure 12: Validation rules configured on the Event object

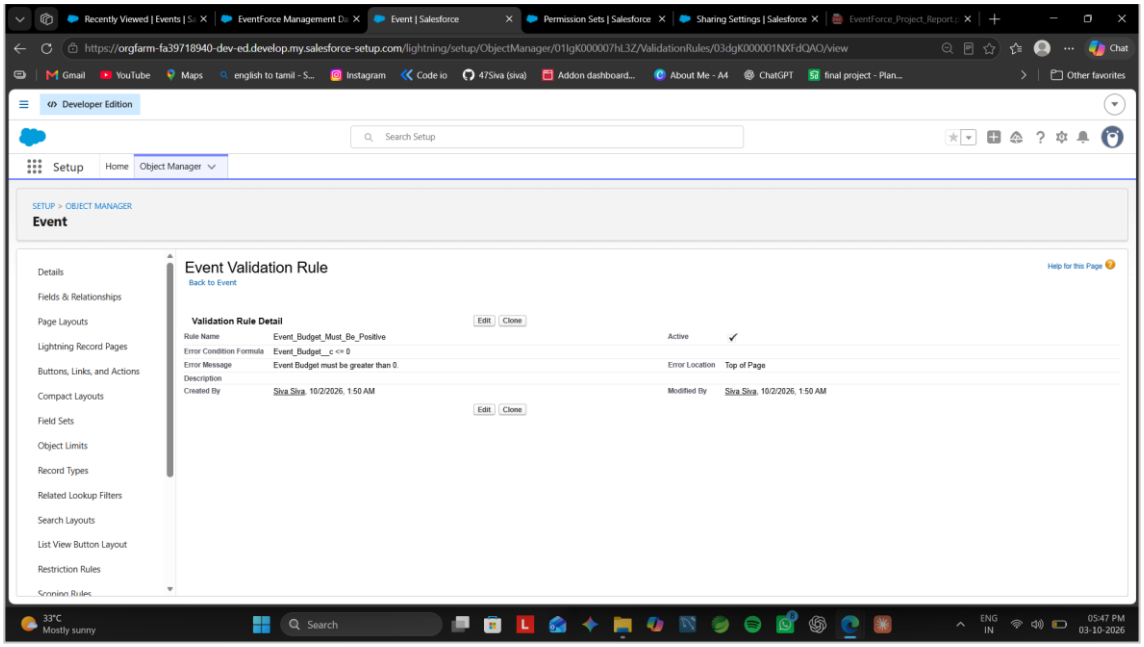

Figure 13: Validation rule: Event_Budget_Must_Be_Positive

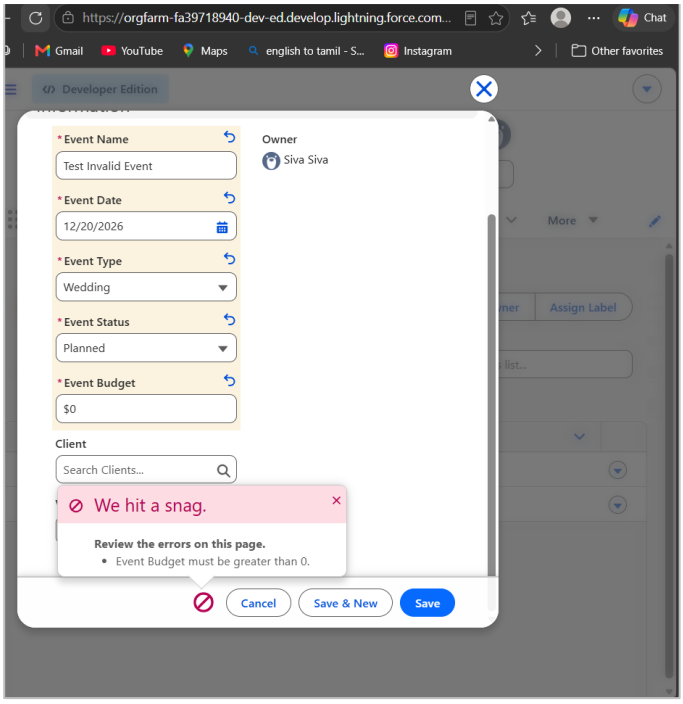

Figure 14: Testing the validation rule – zero event budget is rejected

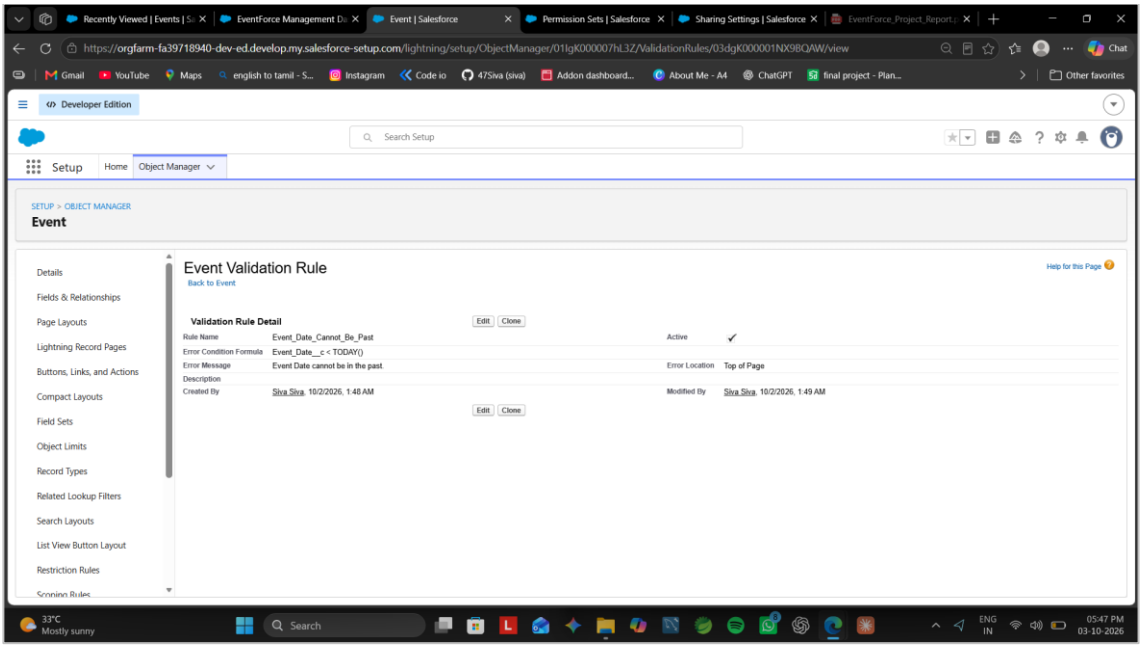

Figure 15: Validation rule: Event_Date_Cannot_Be_Past

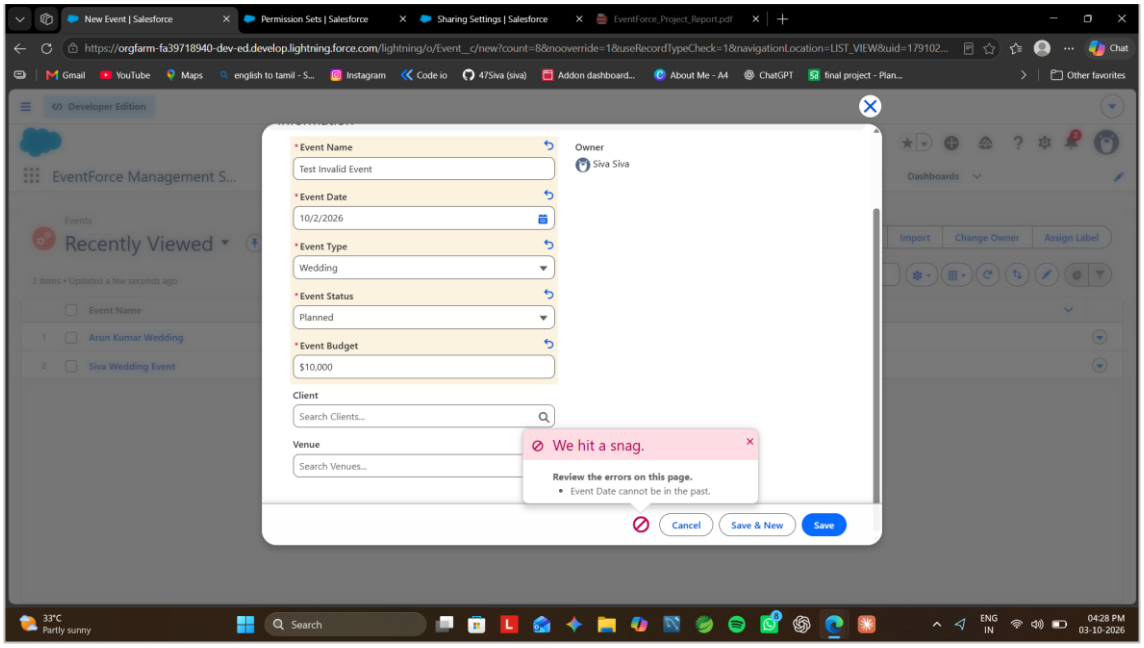

Figure 16: Testing the validation rule – past event date is rejected

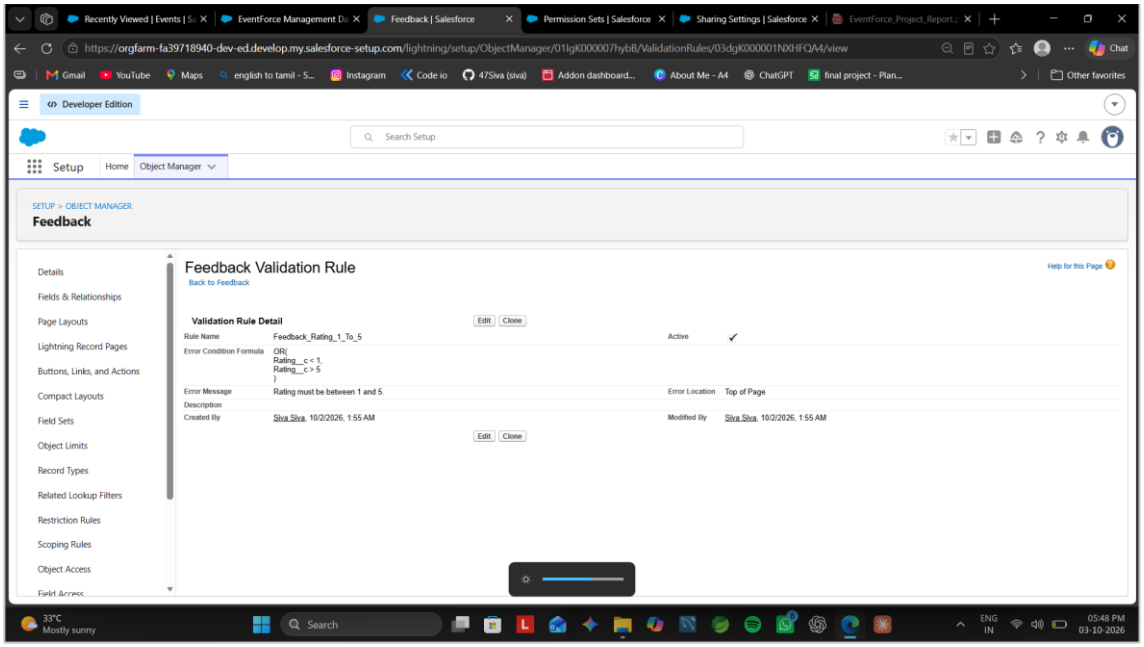

Figure 17: Validation rule: Feedback_Rating_1_To_5

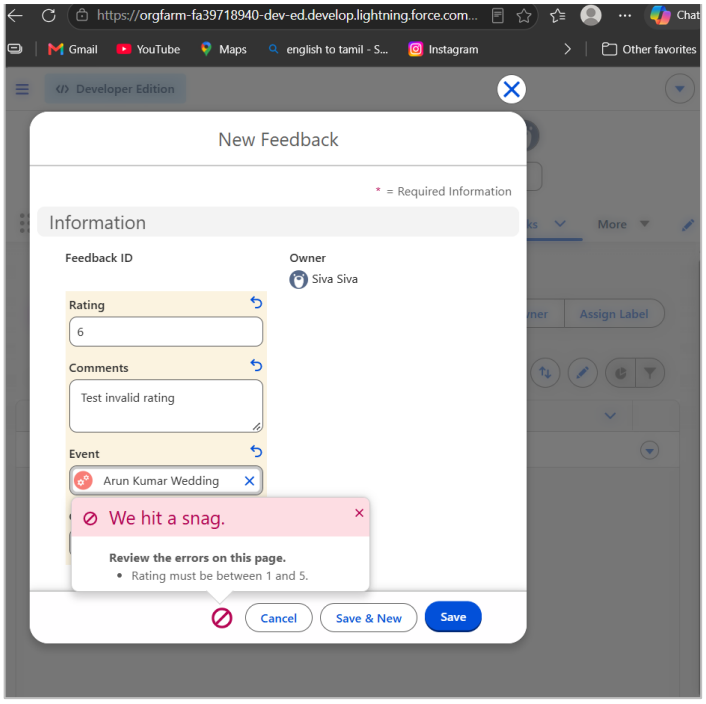

Figure 18: Testing the validation rule – rating above 5 is rejected

8.3 APPROVAL PROCESS

The Event Cancellation Approval Process controls cancellation requests. The process is:

1. User requests event cancellation.
2. Salesforce checks the approval entry criteria.
3. Request is submitted to the configured approver.
4. Approver reviews the request.
5. If approved, the event can be updated to the appropriate cancelled status.
6. If rejected, the event remains in the appropriate active/confirmed state.
7. Notifications can be used to communicate the approval result.

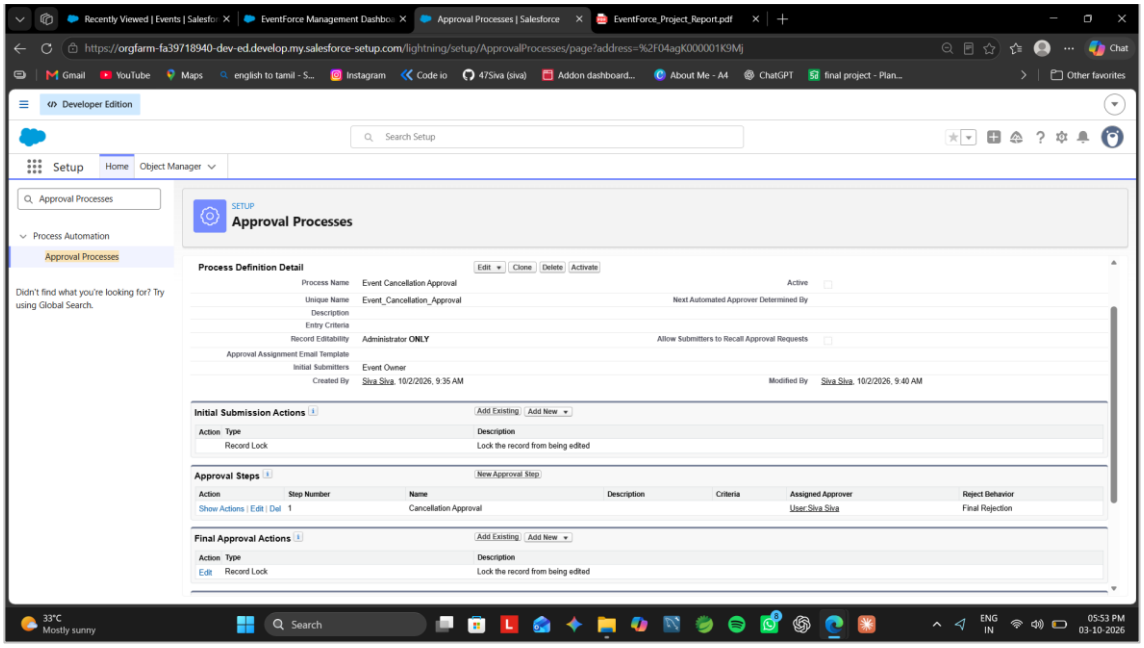

Figure 19: Approval process: Event Cancellation Approval

8.4 APEX DESIGN

Apex is used for business logic that is more complex than declarative configuration. The sample implementation identifies:

- Apex Trigger for venue booking validation.
- VenueStatusHelper for venue availability and double-booking logic.
- Additional Apex processing may be introduced when required by the business rules.

The Apex implementation should validate conflicting Event records for the same Venue and event schedule before allowing a booking to be committed.

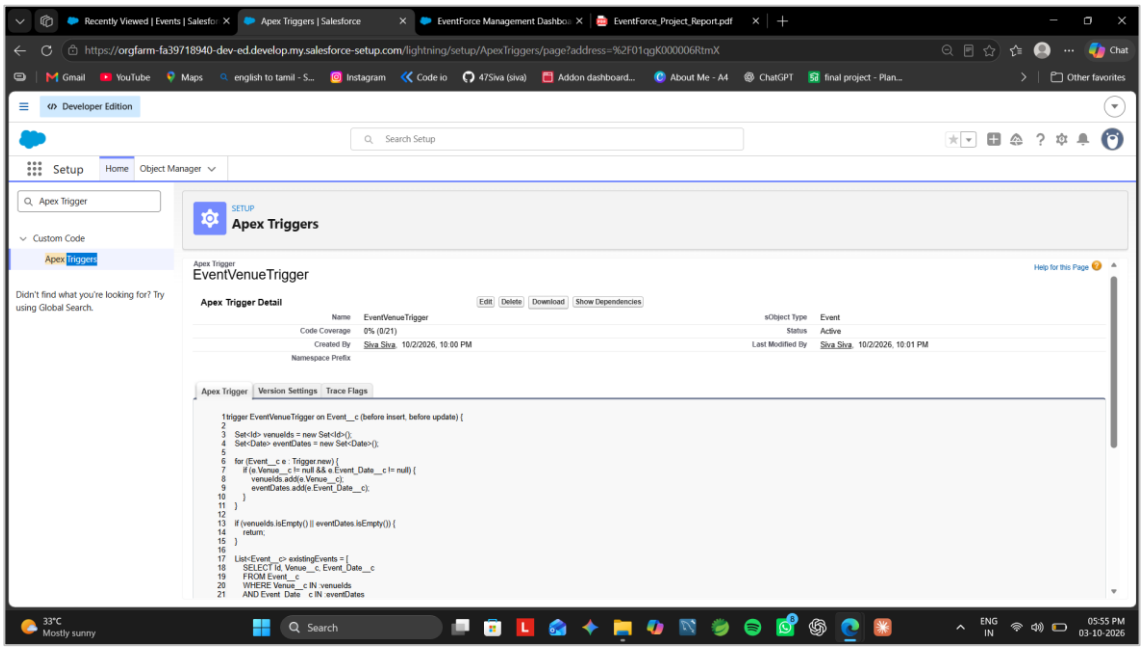

Figure 20: Apex trigger EventVenueTrigger (Active) on the Event object

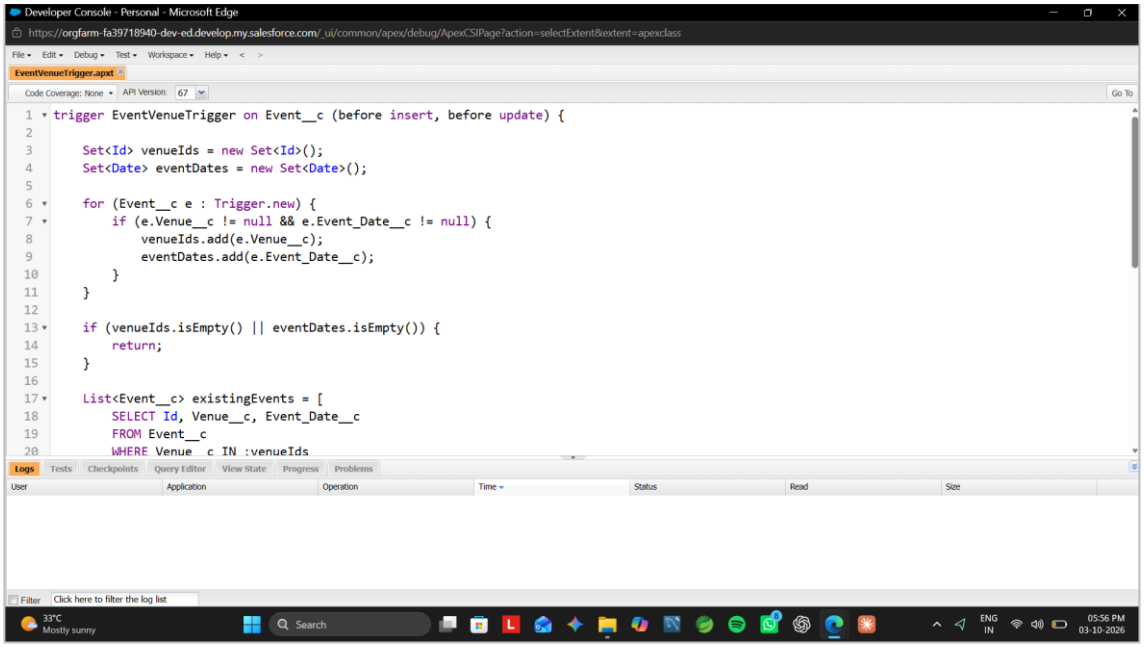

Figure 21: EventVenueTrigger code in Developer Console

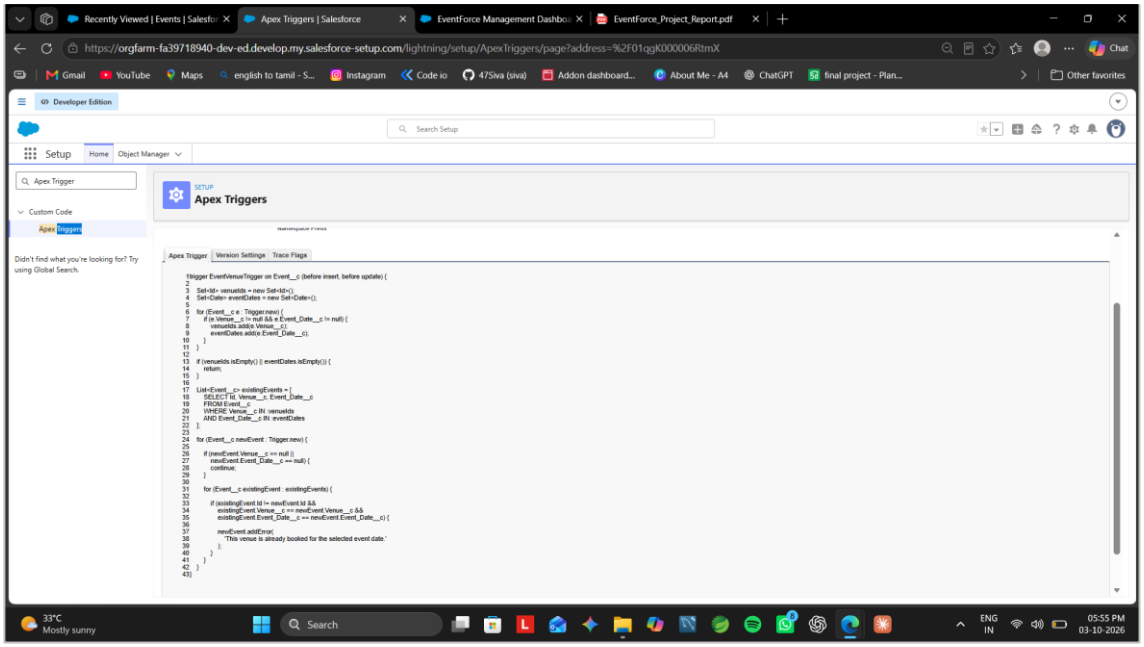

Figure 22: EventVenueTrigger – complete trigger code

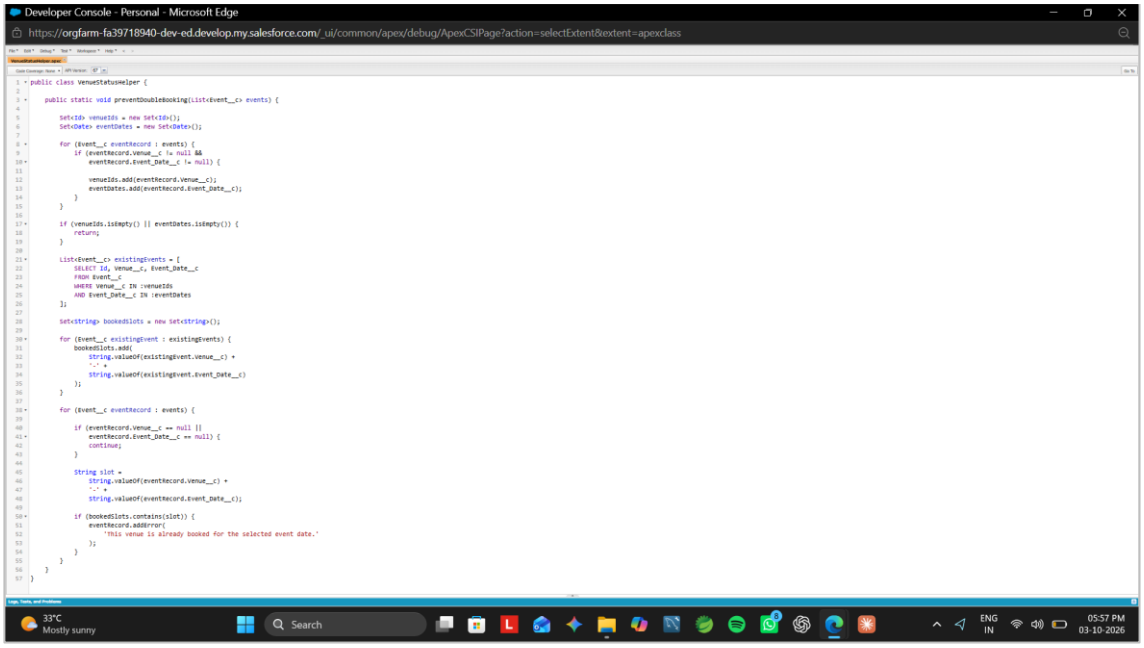

Figure 23: VenueStatusHelper Apex class – preventDoubleBooking method

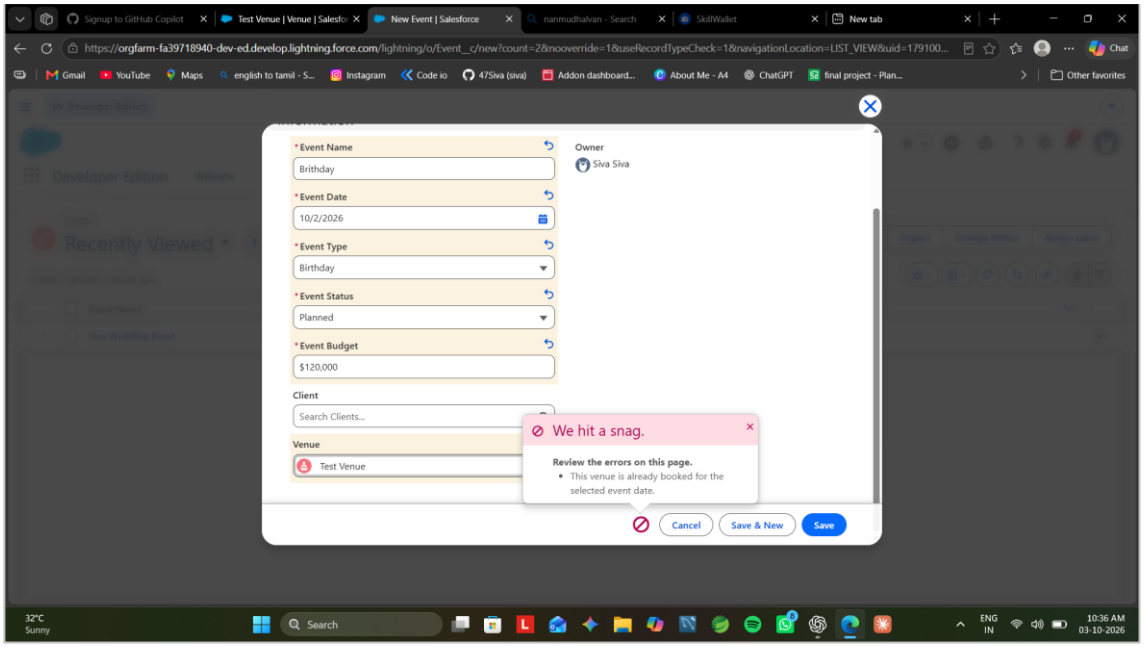

Figure 24: Testing the Apex trigger – venue double booking is blocked

9. PHASE 3 – UI/UX DEVELOPMENT & CUSTOMIZATION

The Salesforce Lightning App provides a user-friendly interface for the EventForce system. The recommended navigation modules are:

- Home
- Events
- Clients
- Venues
- Vendors

- Event Vendors
- Feedback
- Reports
- Dashboards

The Lightning App should provide simple navigation and expose the objects and analytics relevant to each user role.

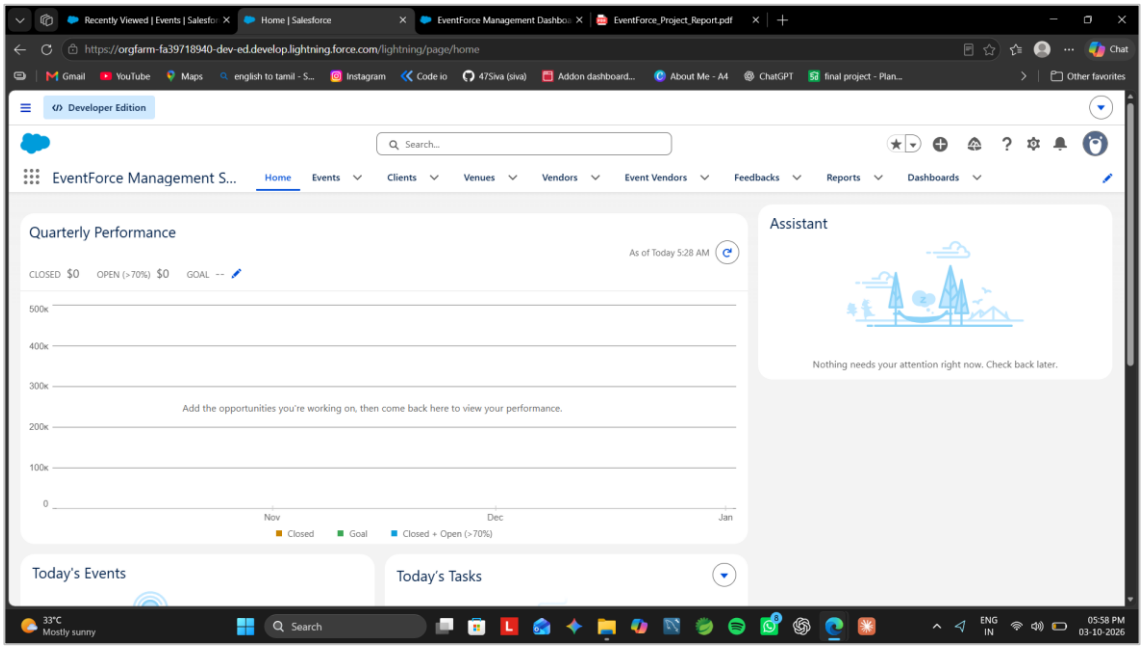

Figure 25: EventForce Management Lightning App – Home page

9.1 REPORTS & DASHBOARDS

The EventForce Operations Dashboard provides operational visibility. Suggested report/dashboard components:

- Upcoming Events by Month
- Event Status Summary
- Confirmed Events
- Cancelled Events
- Venue Availability
- Vendor Performance/Assignments
- Client Feedback Summary

Reports should use the actual Salesforce data available in the organization and should be filtered according to the business requirement.

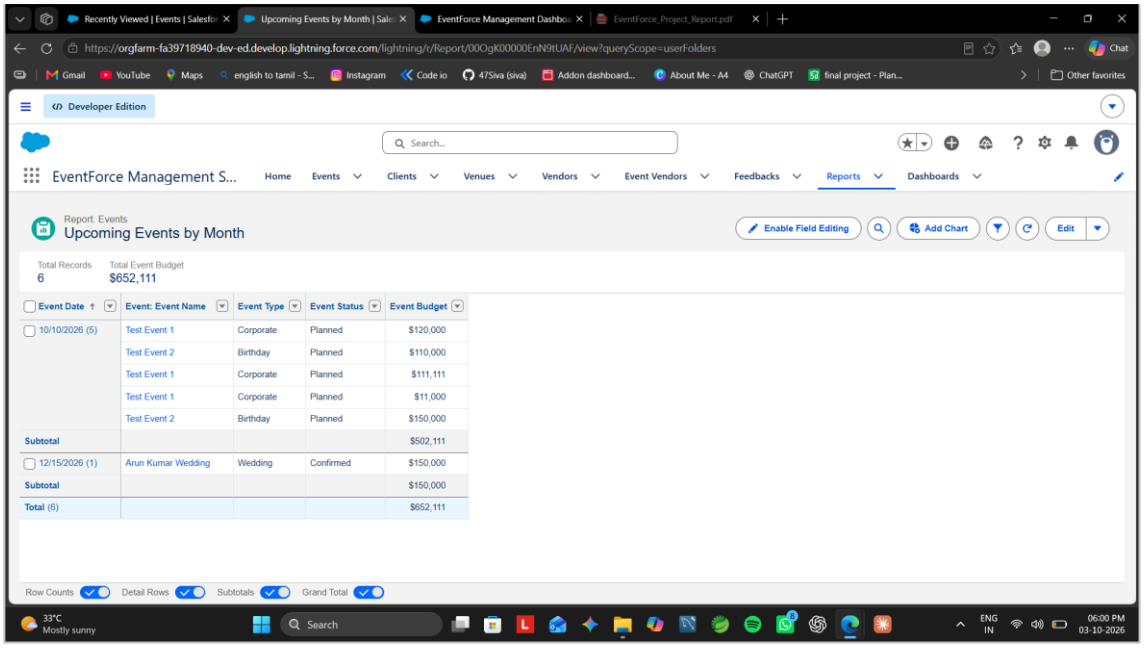

Figure 26: Report: Upcoming Events by Month

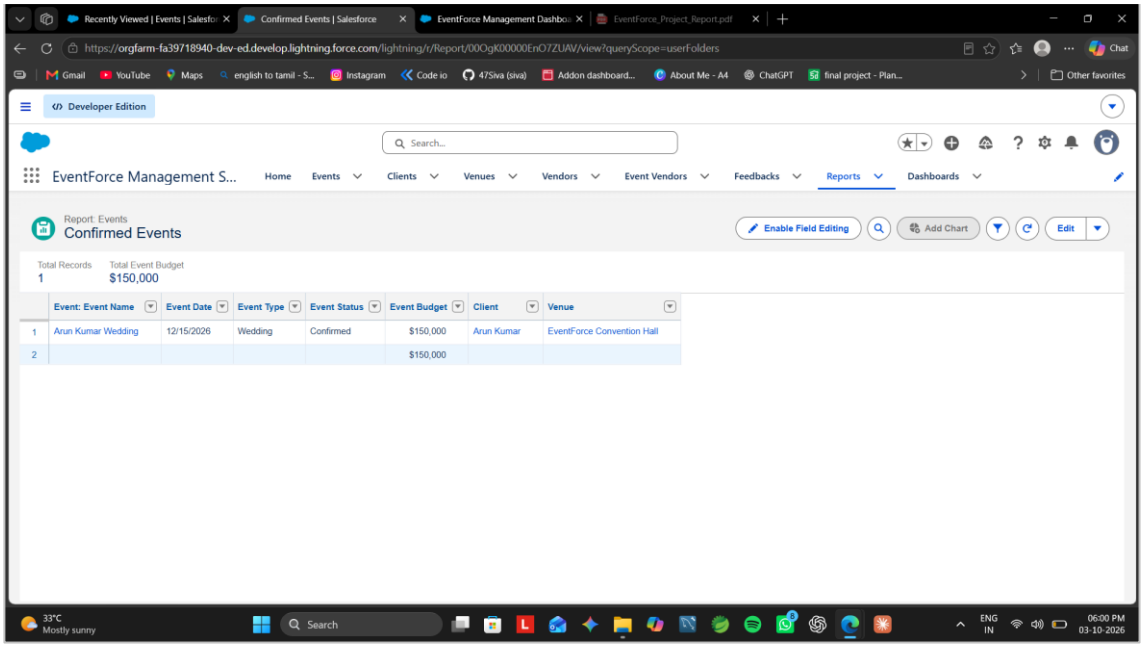

Figure 28: Report: Confirmed Events

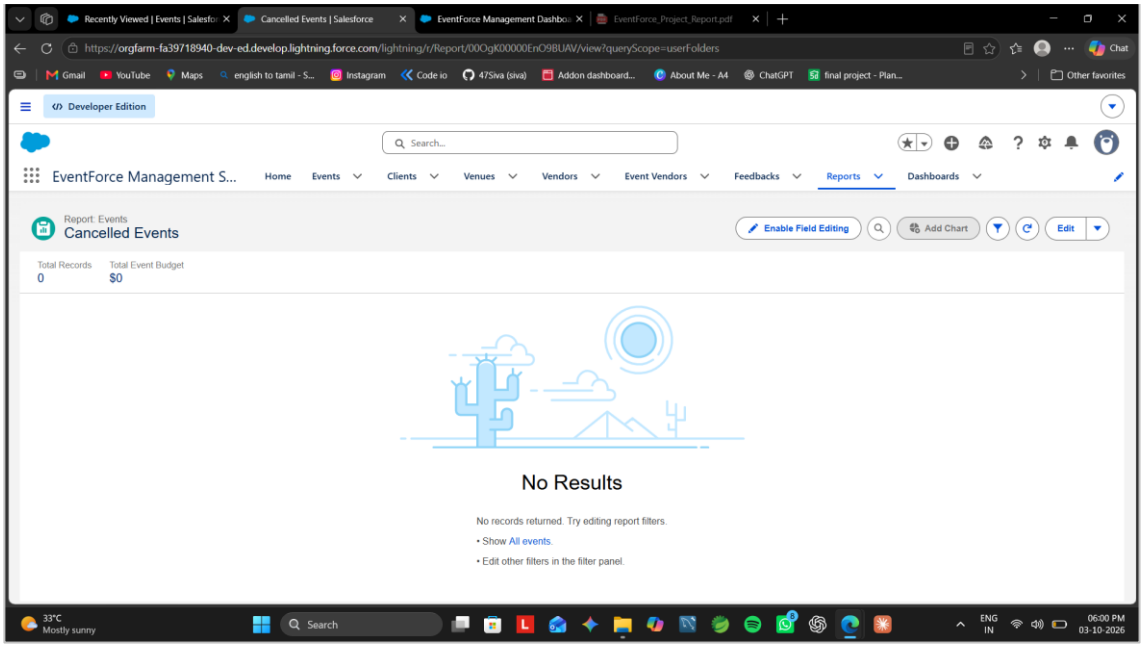

Figure 29: Report: Cancelled Events

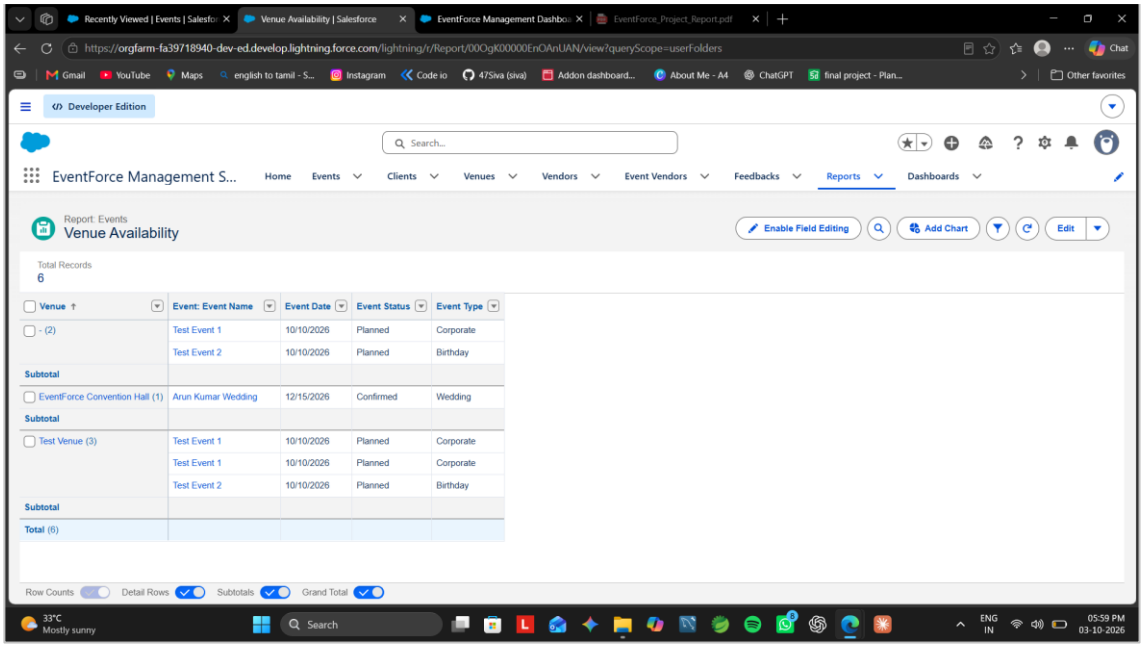

Figure 30: Report: Venue Availability

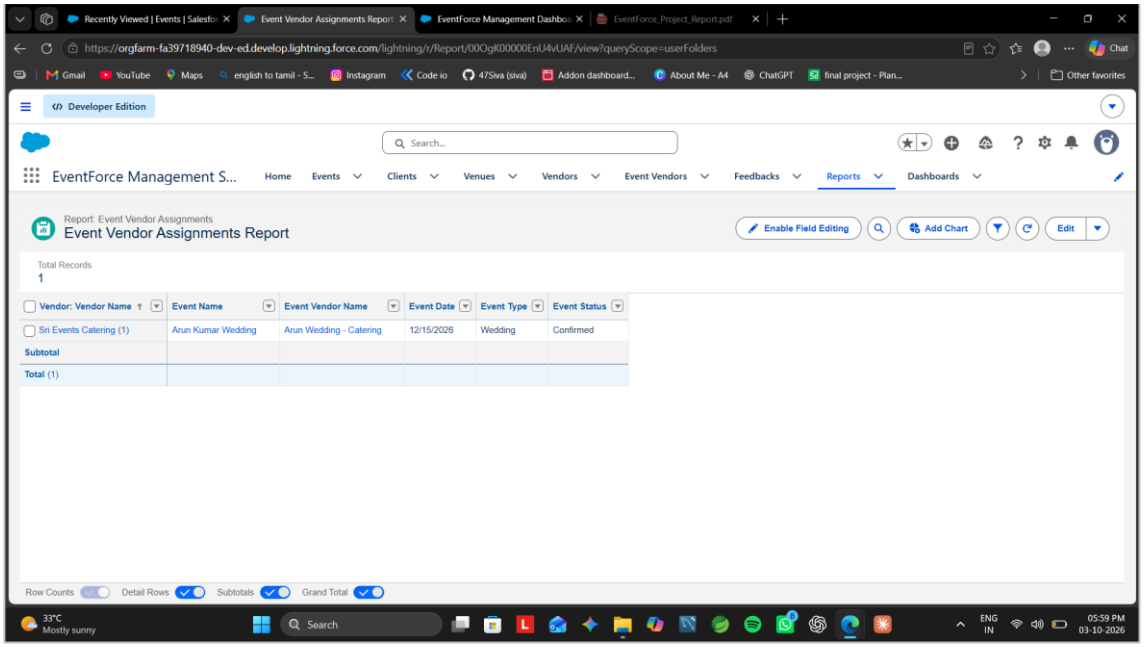

Figure 31: Report: Event Vendor Assignments

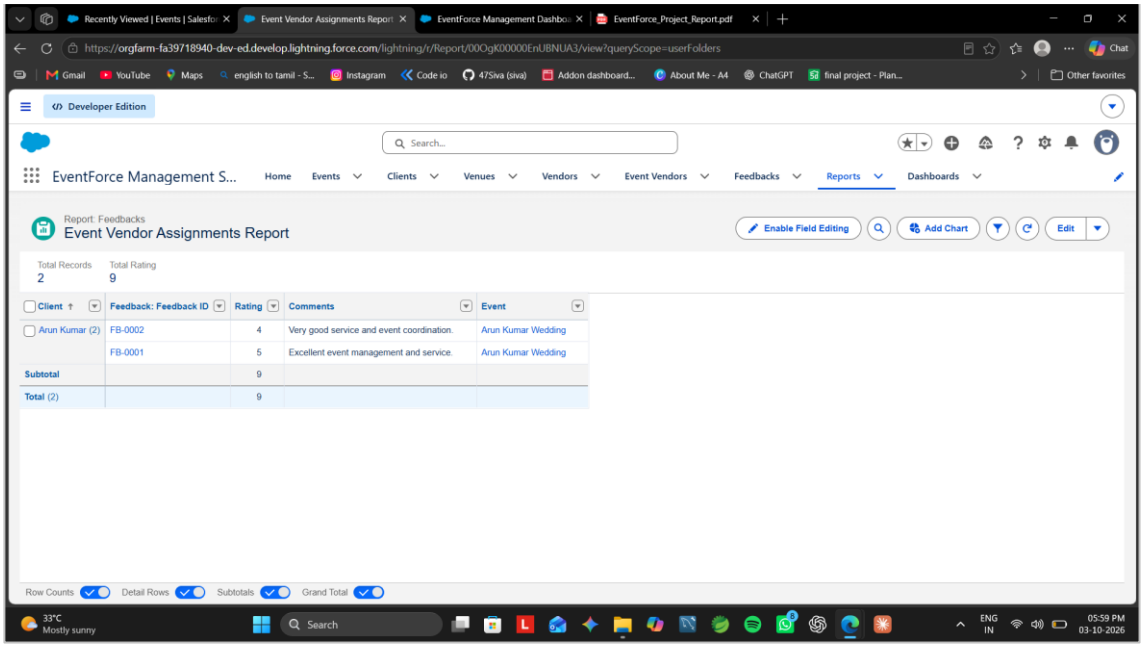

Figure 32: Report: Client Feedback (Feedbacks)

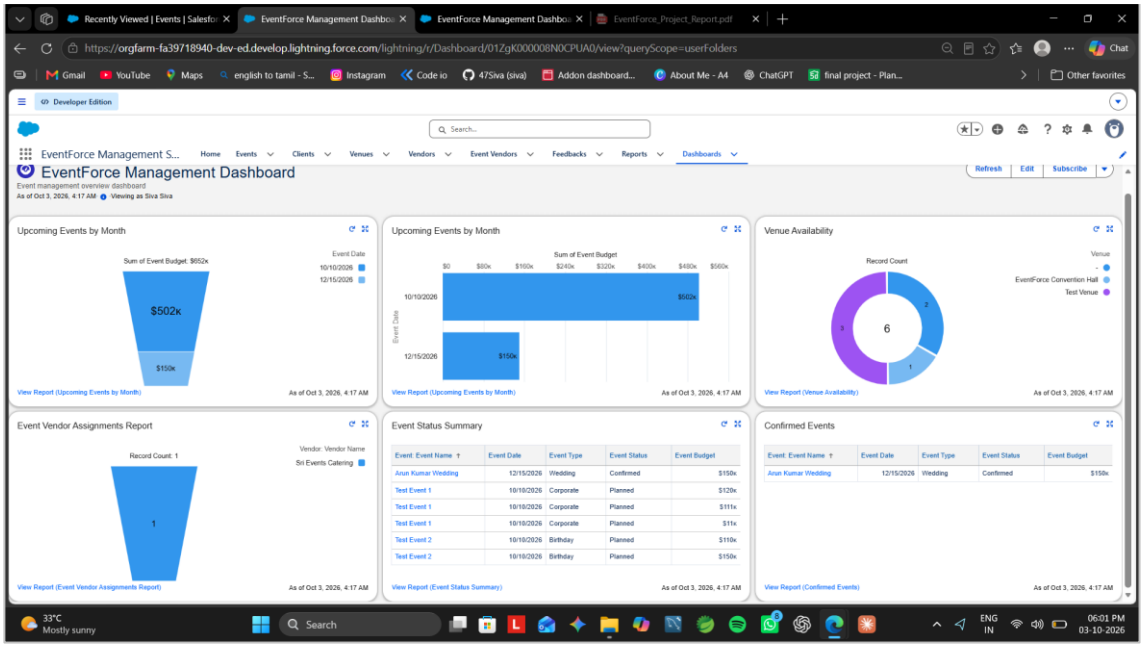

Figure 33: EventForce Management Dashboard

10. PHASE 4 – DATA MIGRATION, TESTING & SECURITY

This phase prepares the solution for operational use. Validated data is imported into Salesforce, users are created, security controls are configured and the complete solution is tested.

Records for Events, Clients, Vendors, Venues and Feedback can be imported using the Data Import Wizard after duplicate and consistency checks.

10.1 SECURITY MODEL

The security model uses:

- Profiles
- Role Hierarchy
- Permission Sets
- Sharing Rules
- Organization-Wide Defaults (OWD)

The sample design sets OWD to Private and uses controlled sharing such as Event_Sharing_For_Vendors where required.

User categories include:

- Event Admin
- Event Coordinator
- Vendor Manager
- Client

A custom Event Admin profile can be created from Setup → Profiles using an existing administration-oriented profile as the base, followed by the required object, field and system permissions.

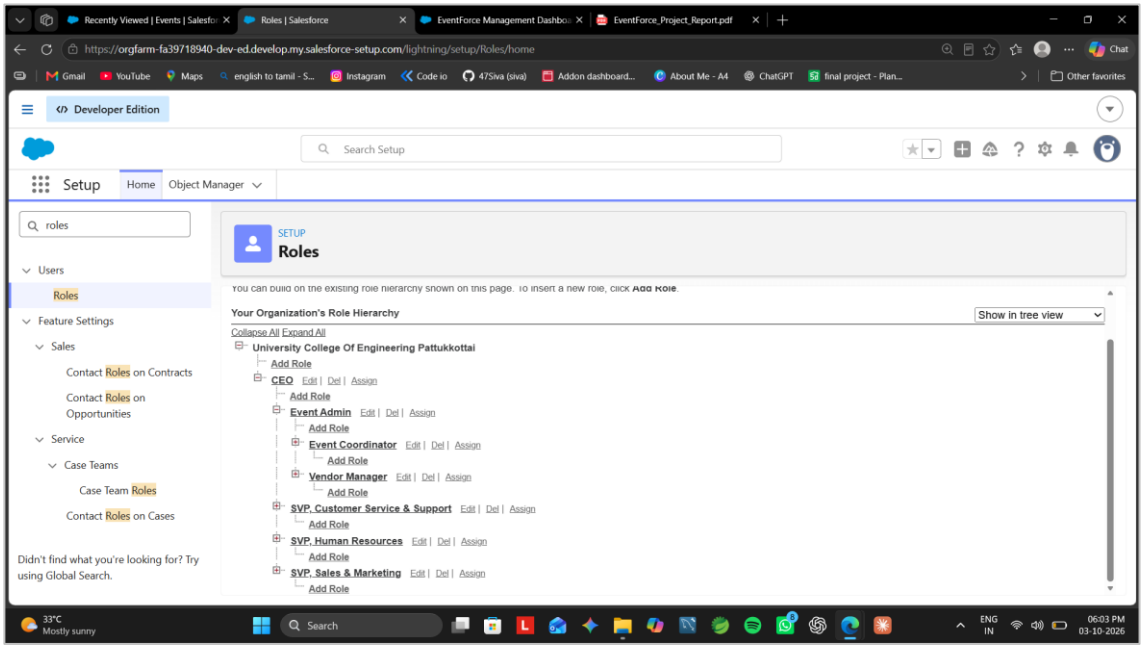

Figure 34: Role hierarchy: Event Admin, Event Coordinator and Vendor Manager

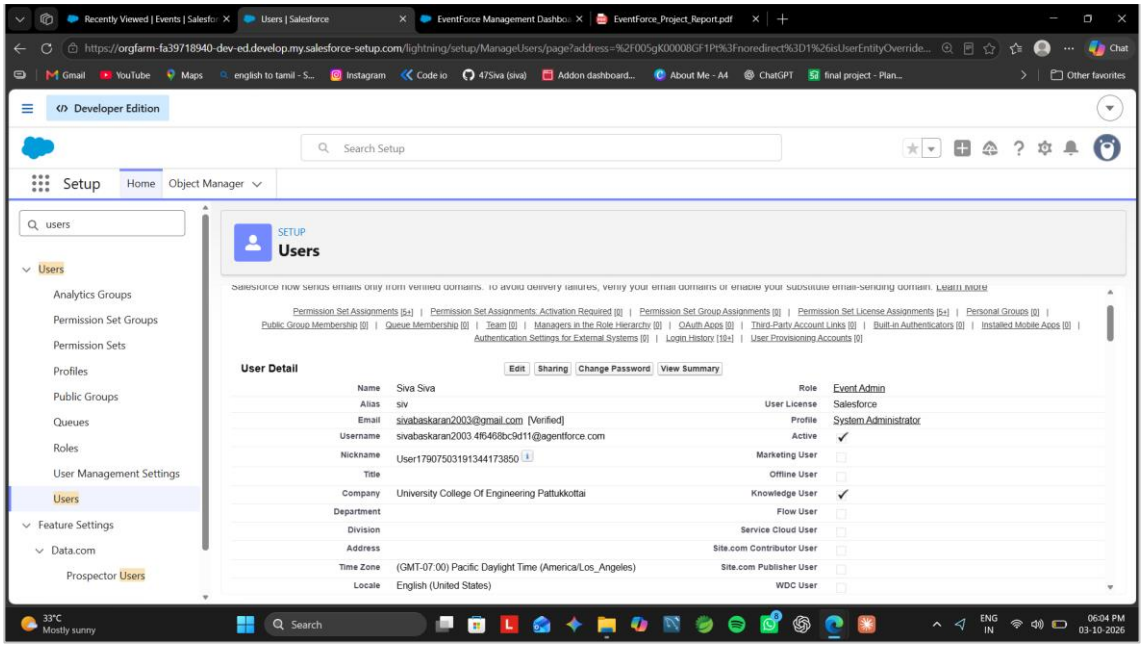

Figure 35: User record with Event Admin role and System Administrator profile

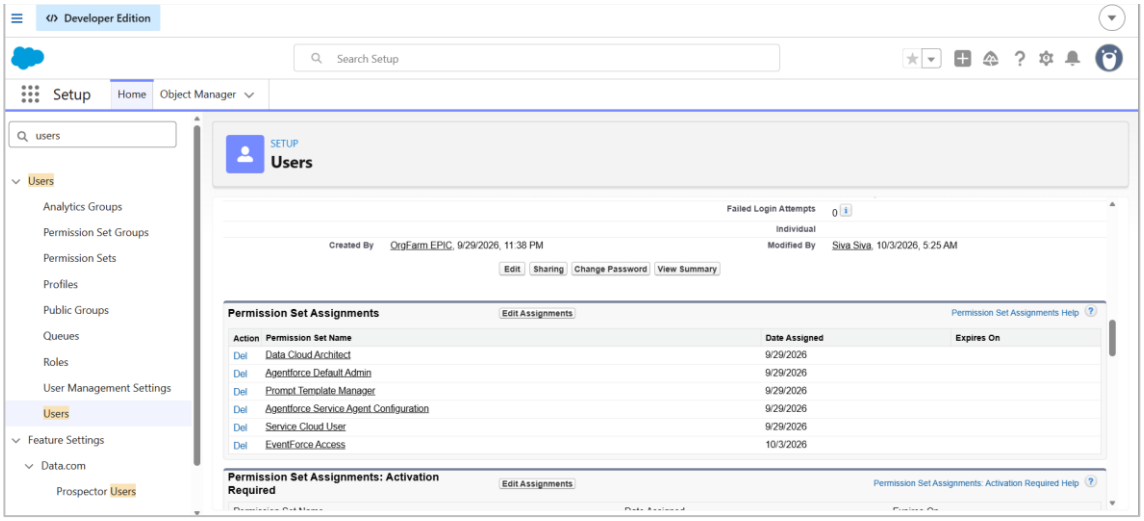

Figure 36: Permission set assignment: EventForce Access

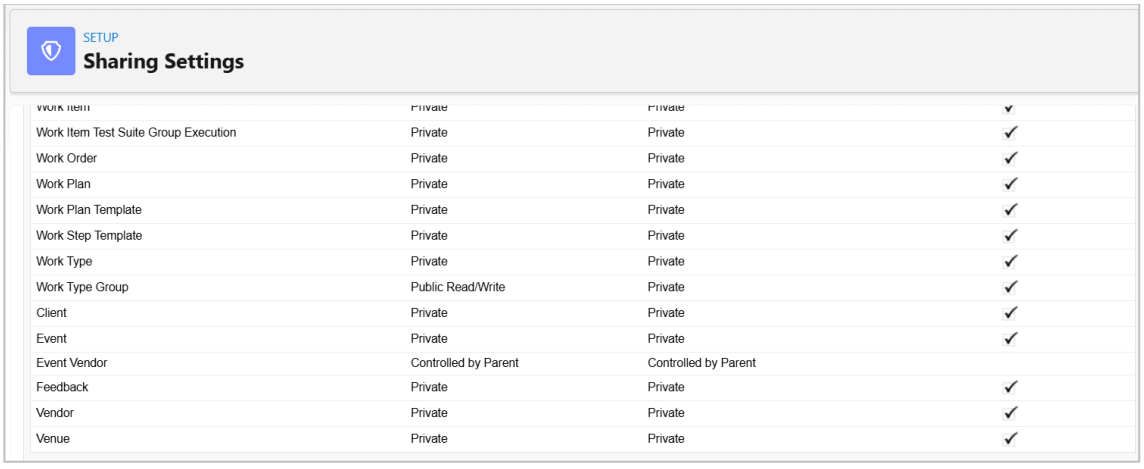

Figure 37: Organization-wide defaults (Sharing Settings) for the custom objects

10.2 DATA MIGRATION

The data migration process is:

1. Prepare source data.
2. Validate required fields and formats.
3. Remove duplicates and inconsistent values.
4. Import Client records.
5. Import Venue and Vendor records.
6. Import Event records with valid relationships.
7. Import EventVendor and Feedback records after parent records are available.
8. Verify record counts and relationships.
9. Test automation after migration.

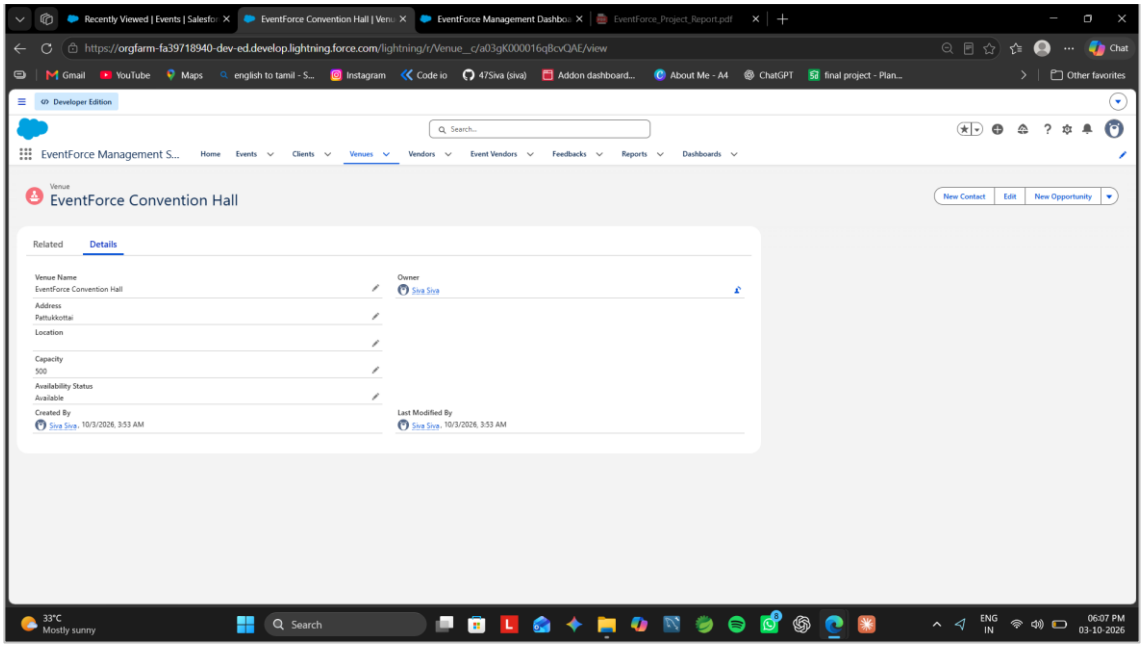

Figure 39: Sample data: Venue record (EventForce Convention Hall)

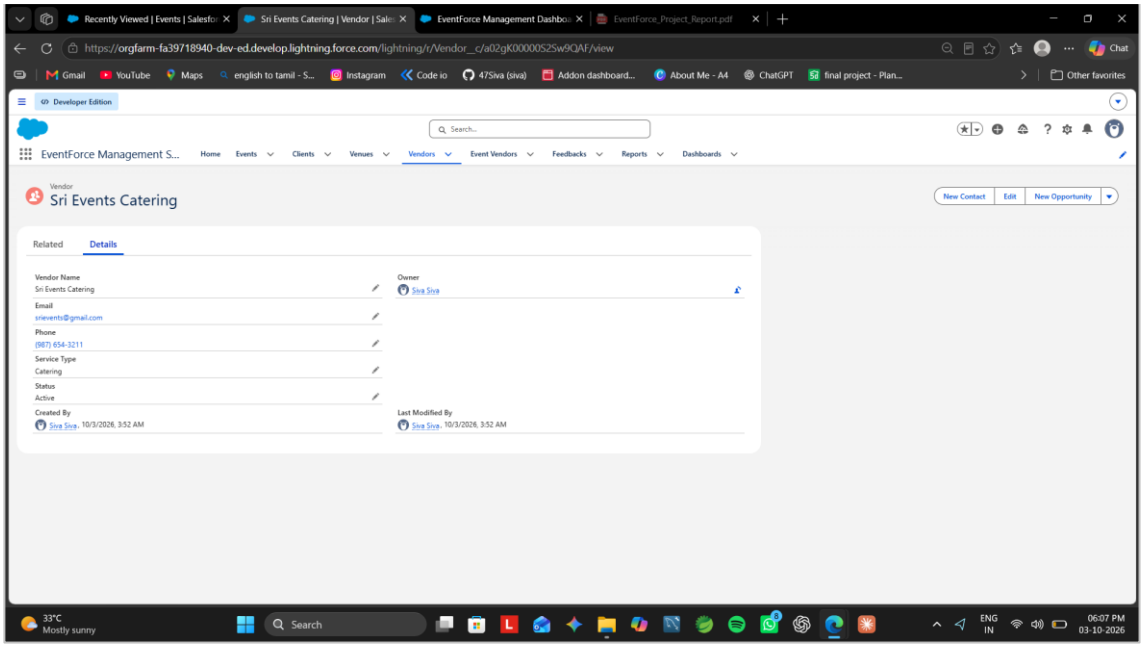

Figure 40: Sample data: Vendor record (Sri Events Catering)

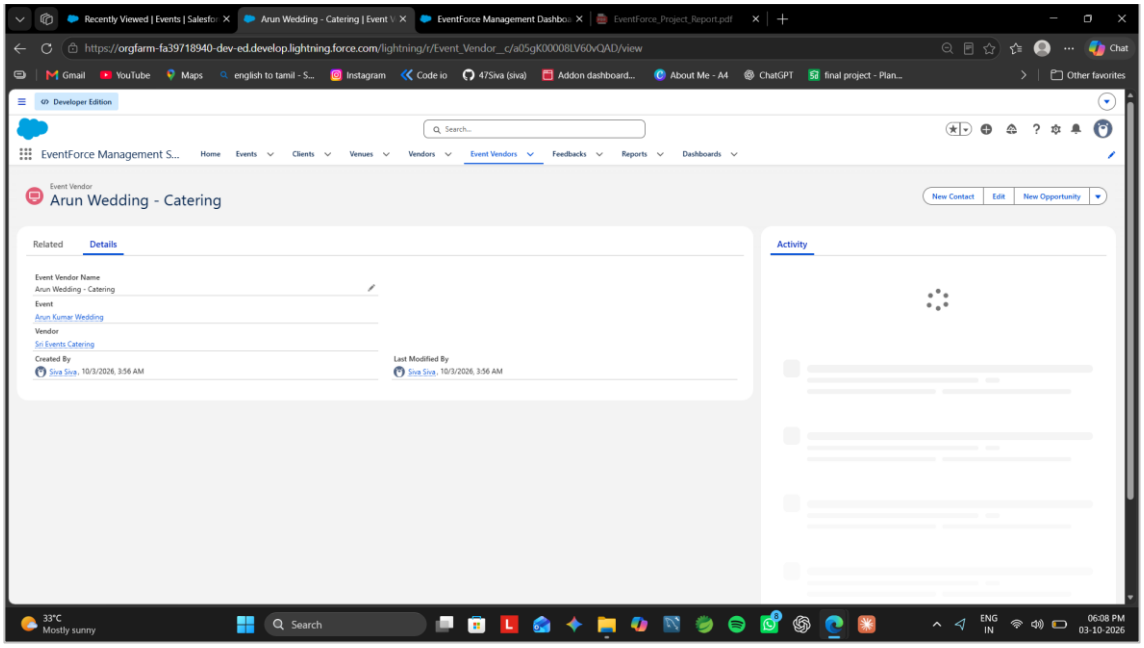

Figure 41: Sample data: Event Vendor record (Arun Wedding – Catering)

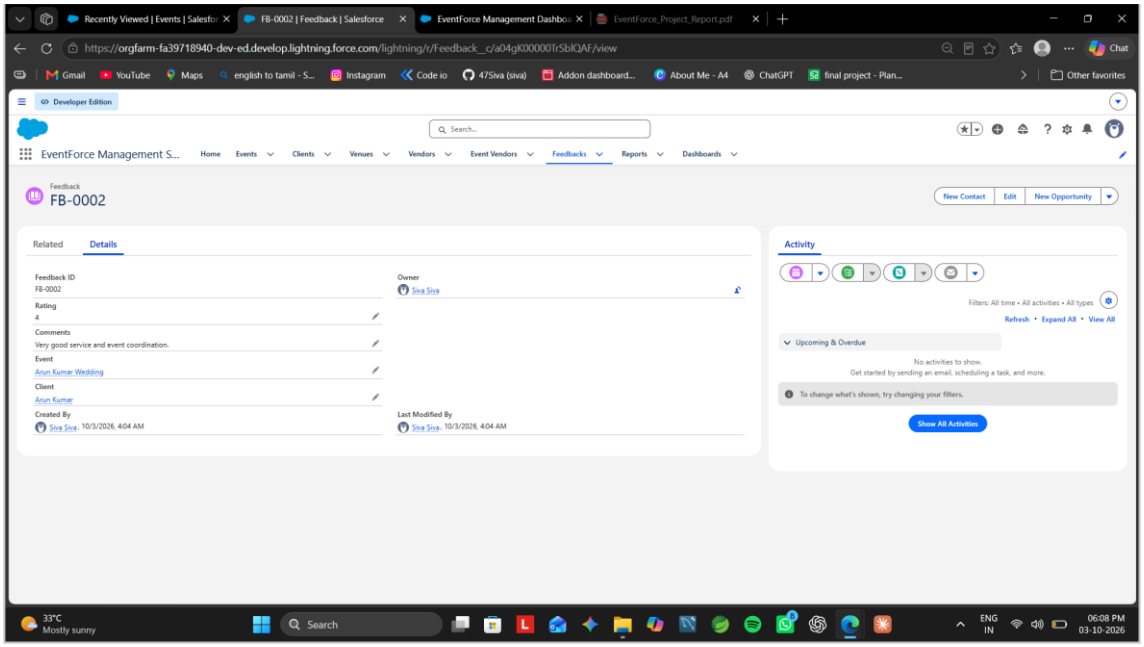

Figure 42: Sample data: Feedback record (FB-0002)

10.3 TESTING STRATEGY

Test Type	What is Verified
Configuration Testing	Objects, fields, relationships, layouts and navigation work as intended.
Automation Testing	Reminders, feedback notifications, event status automation and cancellation approval.
Venue Booking Testing	Attempt to create a conflicting venue booking and verify that the system prevents the double booking.
Security Testing	Log in using the configured user roles and verify that users can access only the records and functions appropriate to their responsibilities.

Test Type	What is Verified
Data Testing	Imported records, relationships, required values and duplicate prevention.
Reports Testing	Report filters, record counts and dashboard components reflect the underlying Salesforce data.

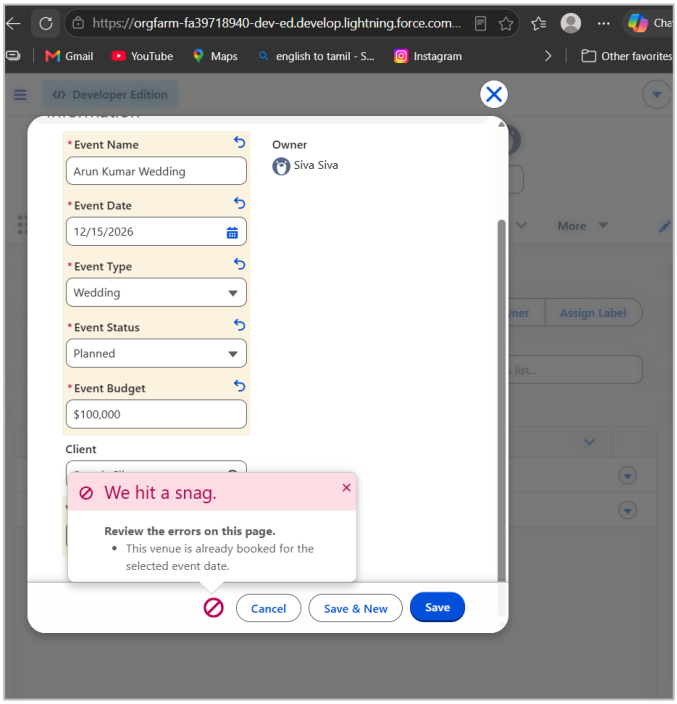

Figure 43: Venue booking test – conflicting booking is blocked

11. IMPLEMENTATION ROADMAP / MILESTONES

No.	Milestone	Description
1	Requirement Analysis	Finalize business scope, stakeholders, requirements and user stories.
2	Custom Objects	Create Event, Client, Vendor, Venue, Feedback and EventVendor objects.
3	Fields & Relationships	Create required fields and configure Lookup/Master-Detail relationships.
4	Validation & Formula Configuration	Implement data-quality rules and required calculations.
5	Automation Flows	Implement reminders, notifications and status-related automation.
6	Approval Process	Implement event cancellation approval and notifications.
7	Apex Logic	Implement venue availability and double-booking prevention.
8	Security	Configure Profiles, Roles, Permission Sets, OWD and Sharing Rules.

No.	Milestone	Description
9	Lightning App	Create the EventForce navigation and user interface.
10	Reports & Dashboards	Create operational reports and the EventForce Operations Dashboard.
11	Data Migration	Import validated sample/business data using the Data Import Wizard.
12	Testing	Perform functional, automation, security, data and reporting tests.
13	Documentation	Capture configuration details, screenshots, test results and final project outcomes.

12. EXPECTED OUTCOMES

The completed EventForce system is expected to:

- Provide a centralized view of event-management information.
- Reduce manual coordination effort.
- Improve consistency of client, event, venue and vendor records.
- Reduce the risk of venue double bookings.
- Provide automated reminders and controlled cancellation approvals.
- Improve visibility into vendor assignments and client feedback.
- Provide role-based access to business information.
- Support operational monitoring through reports and dashboards.

13. FUTURE ENHANCEMENTS

The source project identifies the following future scope:

- Production deployment readiness.
- Advanced automation.
- Enhanced vendor management.
- Advanced analytics.
- External integrations with required systems and services.
- Mobile accessibility.
- Scalability improvements for larger volumes of events, clients, vendors, venues and users.
- Continuous maintenance and optimization of Flows, Apex, validation rules and sharing settings.

14. CONCLUSION

The EventForce Management System demonstrates how Salesforce can be used as a centralized CRM platform for event planning operations. The design combines custom data structures, automation, approval workflows, Apex business logic, security controls, data migration and analytics.

The system provides a structured approach to managing the event lifecycle from client registration and booking through venue and vendor coordination, reminders, cancellation control, feedback and reporting.

The implementation can be developed and tested in a Salesforce Developer Edition or suitable Salesforce environment before considering production deployment. The final configuration should be validated against actual business rules and tested with representative data before operational use.

15. APPENDIX

Ref.	Area	Components
A	Custom Objects	Event, Client, Vendor, Venue, EventVendor, Feedback.
B	Automation	Flows, Validation Rules, Approval Process, Apex Triggers and Classes.
C	Processing	Batch Apex and Scheduled Apex are listed in the source project as possible processing components where required.
D	Security	Profiles, Roles, Permission Sets, OWD and Sharing Rules.
E	Data Migration	Salesforce Data Import Wizard.
F	UI & Analytics	Lightning App, Reports and Dashboards.
G	Testing & Documentation	Configuration testing, security testing, automation testing and project documentation.

REQUIREMENT TRACEABILITY TABLE

Requirement	Salesforce Component	Validation / Output
FR-1 Event Management	Event__c, fields, Lightning App	Event records can be created and managed
FR-2 Client Management	Client__c + Event→Client	Client information linked to events
FR-3 Venue Management	Venue__c + Event→Venue	Venue data and availability maintained
FR-4 Vendor Management	Vendor__c	Vendor details and service information maintained
FR-5 Event–Vendor Assignment	EventVendor__c	Multiple vendors can be associated with an event
FR-6 Double-Booking Prevention	Apex Trigger + VenueStatusHelper	Conflicting venue booking is rejected
FR-7 Event Reminders	Flow	Reminder action occurs for qualifying upcoming events
FR-8 Cancellation Approval	Approval Process	Cancellation follows configured approval
FR-9 Feedback	Feedback__c + Flow	Feedback stored and notifications supported
FR-10 Reporting	Reports + Dashboard	Operational insights displayed

Requirement	Salesforce Component	Validation / Output
FR-11 Status Automation	Flow / automation	Event status updated by configured rules
FR-12 Data Migration	Data Import Wizard	Validated records imported into Salesforce

USER STORY / SPRINT TRACEABILITY

Sprint	Story	Description	Points	Priority
Sprint-1	US-01	Create events with type, date and status	3	High
Sprint-1	US-02	Associate client and venue with an event	5	High
Sprint-2	US-03	Assign multiple vendors to an event	5	High
Sprint-2	US-04	Provide timely event reminders	3	High
Sprint-3	US-05	Route cancellation requests through approval	5	High
Sprint-3	US-06	Prevent venue double bookings	8	High
Sprint-4	US-07	Provide role-based access	5	High
Sprint-4	US-08	Provide reports and dashboards	5	Medium

PROJECT IMPLEMENTATION CHECKLIST

- ☐ Requirement analysis completed
- ☐ Stakeholders and user roles identified
- ☐ Custom objects created
- ☐ Required fields created
- ☐ Object relationships configured
- ☐ Validation rules configured
- ☐ Formula fields configured where required
- ☐ Reminder and notification Flows configured
- ☐ Cancellation Approval Process configured
- ☐ Venue double-booking Apex logic configured and tested
- ☐ Lightning App configured
- ☐ Reports created
- ☐ EventForce Operations Dashboard created
- ☐ Profiles / Roles / Permission Sets configured
- ☐ OWD and Sharing Rules configured
- ☐ Sample data imported and validated
- ☐ Functional testing completed
- ☐ Automation testing completed
- ☐ Security testing completed

☐ Final screenshots and documentation captured

REFERENCE NOTE

This project report was prepared from the supplied EventForce Management System – Salesforce Implementation sample document. The terminology, core scope, object model, requirements, Agile stories, implementation phases, security model, automation concepts and future scope are aligned with that source. Actual Salesforce field API names, formulas, Flow entry criteria, Apex code, user permissions and test evidence should be updated after the implementation is performed in the target Salesforce org.
